CSE 417T: Homework 1

Due: February 7 (Friday), 2020

Notes:

- Please submit your homework via Gradescope and check the submission instructions.
- Please complete and submit the following two stub Matlab files for Problem 2.
  - http://chienjuho.com/courses/cse417t/hw1/perceptron_experiment.m
  - http://chienjuho.com/courses/cse417t/hw1/perceptron_learn.m
- There will be two submission links for homework 1: one for report and the other for code. **Your score will be based on the report.** The code you submit is only used for checking the correctness and for running plagiarism checkers.
  - Report: Make sure you include all explanations and results in the report. Any results/explanations written in the code will not be graded.
  - Code: You only need to submit your code for Problem 2 (fill in the two stub files and submit them). Your code will only be used for checking correctness (especially when/if we think there are discrepancies) and for running plagiarism checkers.
  - We plan to run automatic plagiarism tests for the code submissions (including the code submitted in previous semesters). The tests are performed after some initial level of compilation, so changing variable names and changing code sequences will be detected. Submissions that are too similar to other sources will be considered as violations of academic integrity and will be reported to the university.
- Make sure you specify the pages for each problem correctly. You will not get points for problems that are not correctly connected to the corresponding pages.
- Homework is due by 11:59 PM on the due date. Remember that you may not use more than 2 late days on any one homework, and you only have a budget of 5 in total.
- Please keep in mind the collaboration policy as specified in the course syllabus. If you discuss questions with others you must write their names on your submission, and if you use any outside resources you must reference them. Do not look at each others' writeups, including code.
- There are 7 problems in this homework.
- Keep in mind that problems and exercises are distinct in LFD.
- All graphs should have clearly labeled axes. The Matlab hist function should be useful.
Problems:

1. (25 points) LFD Problem 1.3. You need to answer this problem even if you submitted HW0.

2. (25 points) Consider the following experiment on running perceptron learning algorithm (PLA) for random training sets of size 100 and dimension 10 (i.e., $N = 100$ and $d = 10$).
   - Create a random optimal separator $\vec{w}^*$:
     Generate an 11-dimensional weight vector $\vec{w}^*$, where the first dimension (i.e., $w^*_0$) is 0 and the other 10 dimensions are sampled independently at random from the uniform $(0, 1)$ distribution (we just set $w^*_0$ to 0 for convenience).
   - Generate a random training set with 100 examples, i.e., $D = \{(\vec{x}_1, y_1), \ldots, (\vec{x}_{100}, y_{100})\}$, that are separable by $\vec{w}^*$:
     For each training example $\vec{x}$, sample each of the 10 dimensions independently at random from the uniform $(-1, 1)$ distribution (Note that you need to insert $x_0 = 1$ for each data point $\vec{x}$). Calculate the label $y$ of each sample point $\vec{x}$ by using the separator $\vec{w}^*$.
   - Run the perceptron learning algorithm:
     Run PLA on the training set you just generated, starting with the zero weight vector. Keep track of the number of iterations it takes to learn a hypothesis that correctly separates the training data.

Write code in Matlab to perform the above experiment and then repeat it 1000 times (note that you’re generating a new $\vec{w}^*$ and a new training set $D$ each time). We have provided two stub files that you should complete for this purpose. The files have comments that explain their inputs and outputs.

Summarize your results in the report. In particular, include the following:
   - Plot a histogram of the number of iterations PLA takes to learn a linear separator.
   - Compare the number of iterations with the bound derived in Problem 1. Note that the bound will be different for each instantiation of $\vec{w}^*$ and the training set $D$. In order to answer this question, you should analyze the distribution of differences between the bound and the number of iterations. Plot a histogram of the log of this difference.
   - Discuss your interpretation of these results.

You need to submit both your code and the report of this problem. You only need to submit the two Matlab files in the code submission. You would need to write additional code to plot figures, etc, but you do not need to submit the additional code.

3. (10 points) LFD Exercise 1.10 (a) to (d). You do not need to submit code for this problem.
   (Note that exercise and problem are different in LFD! Exercises are embedded within chapters, and problems are listed after the end of each chapter.)
   - Hint: You should be able to run a single simulation (i.e., flipping 1000 fair coins independently 10 times each, and finding the frequency of heads for each of them) in one line of Matlab code. Check out `randi` and `mean`.

4. (10 points) LFD Problem 1.8
5. (10 points) LFD Problem 1.12
6. (10 points) LFD Problem 2.3
7. (10 points) LFD Problem 2.8. Please provide explanations.
